What is the largest component of the price of electricity?

The cost of generating electricity is the largest component of the price of electricity. The cost to supply electricity changes minute by minute. However, most consumers pay rates based on the seasonal cost of electricity. Changes in prices generally reflect:

Why do some utilities offer time-of-day electricity prices?

Some utilities offer their customers time-of-day pricing to encourage electricity conservation and to reduce peak demand for electricity. Retail electricity prices are usually highest for residential and commercial consumers because it costs more to distribute electricity to them.

Why do power plants cost so much?

During many hours of the year, the power plants that set energy prices run on natural gas, and the cost of fuel is the single largest component of the overall cost of operating those plants.

Can a power plant be turned off during a low price?

Both types of plants cannot easily be turned off during periods of low prices, because the production of heat and system services is linked to electricity generation. They are forced to produce electricity despite negative margins, a phenomenon sometimes called "must-run".

How does the market value of a power plant differ?

Market value differs. The market value of power plants differs based on how these plants are designed and operated. Base load plants, which are designed to run around the clock, earn the (relatively low) average electricity price or the "base price".

Why do we need power supplies?

Power supplies are vital for our components to perform at peak performance. Until now, most people did not invest a lot of money in the acquisition of this component, but they could access a product with decent features at a price to match.

Surface power density measures power per unit surface area using given technology, and can vary by several orders of magnitude between high- and low-density sources.
